Discussion Questions

Refer to Question 1 in the lab assignment. Which example (phone number, age, credit card number, or name) do you think would be the most challenging to properly validate? Why?

The 2 most challenging to properly validate in my opinion would be phone number and credit card number .I believe these 2 would be the hardest to validate because you must first check the length the type a the format of the input and then to 100% validate the input you would have to do some type of external check to make sure the phone number or credit card number is actually valid / usable .

What are the challenges of adding input validation to your program?

Adding input validation has the potential to add vulnerability to the program if done thoroughly

Describe some input validation that you have encountered when using software such as registering for courses, checking your account balance, using a game, ordering an item online. Have you ever encountered a problem with the validation?

No problems that i can remember
